

Day 2

Let's continue to build the portal. Below are the details

- The platform will also be able to expose the student details through an API. Below is how it will work:
 - An **API** will be exposed to list all students that are available in our portal by default.
 - The same API will update its response if specifications are mentioned while calling the API. For example,
 - stream
 - Joining year
- Delete old data
 - If a notice posted on the dashboard whose event date is past the current date, then that notice should be deleted.
 - Any student whose graduation is already 6 months old, then the student records should be deleted from the portal.
